

## PhD position in experimental nuclear astrophysics

---

### New Judicious Experiments for Dark sectors Investigations First Experiment

---

Understanding the composition and functioning of our Universe are among the most fundamental and challenging questions in Physics. To date, the intrinsic nature of dark matter remains a mystery. The New JEDI project aims to study through several nuclear physics experiments a fascinating alternative scenario, such as the existence of an indirect interaction between ordinary matter, well described by the Standard Model, and the Dark Sectors of the Universe via portals (so called bosons). In other words, does a new fifth force of nature exist? The construction of a new detection system (named New JEDI as well) has been completed in 2021. As opposed to all other experiments, New JEDI is designed to be versatile in order to make a proposal for a large-scale broadband experimental program. The project relies on pathfinder experiments conducted at the ARAMIS facility (Fr). The commissioning of New JEDI has been completed successfully on June 2021 at a tandemron facility (Cz). The first experiment will take place Orsay beginning of 2022, at the ANDROMEDE facility. We plan to develop a long-term research program in the MeV terra incognita energy range at the new SPIRAL2 facility (Fr), that will deliver unique high-intensity beams of light, heavy-ions and neutrons in Europe.

This project outlines as well an ambitious experimental program to advance to new levels the precision on Big Bang Nucleosynthesis (BBN) modelling. The New JEDI project gathers world-wide experts on nuclear physics and astrophysics, dark sectors theory and BBN.

The PhD thesis will be about the analysis of the first new JEDI experiment that will take place at ANDROMEDE. The student will participate actively on the New JEDI experimental program as well.

The main supervising team will be composed of: Beyhan BASTIN (GANIL), Jurgen Kiener (IJCLab), François De Oliveira (GANIL), Isabelle Deloncle (IJCLab) and Alain Coc (IJCLab).

#### Expected skills:

Very good levels on C/C++ programming, English, Nuclear Physics and/or Particle Physics academic knowledge. Affinity for experimental work and work in an international environment.
